Elektrochemická a spektroskopická analýza chřipkového proteinu

Školitel :

Marie Konečná

Datum:

21.2.2014

Reg.č.projektu: CZ.1.07/2.4.00/31.0023

Název projektu: Partnerská síť centra excelentního bionanotechnologického výzkumu

Sequences of Pandemic-Causing Viruses Isolated and Detected by Paramagnetic Particles Coupled with Microfluidic System and **Electrochemical** Detector

Flow Injection **Electrochemical** Analysis of Complexes of Influenza Proteins with CdS, PbS and CuS Quantum Dots

Development of a Magnetic **Electrochemical** Bar Code Array for Point Mutation Detection in the H5N1 Neuraminidase Gene

Quantum Dots for **Electrochemical** Labelling of Neuramidinase Genes of H5N1, H1N1 and H3N2 Influenza

Paramagnetic Particles Isolation of Influenza Oligonucleotide Labelled with CdS QDs

Using of Paramagnetic Microparticles and Quantum Dots for Isolation and **Electrochemical** Detection of Influenza Viruses' Specific Nucleic Acids

Electrochemical Sensors and Biosensors for Influenza Detection

Paramagnetic particles coupled with an automated flow injection analysis as a tool for influenza viral protein detection

Easy to use and rapid isolation and detection of a viral nucleic acid by using paramagnetic microparticles and carbon nanotubes-based screen-printed electrodes

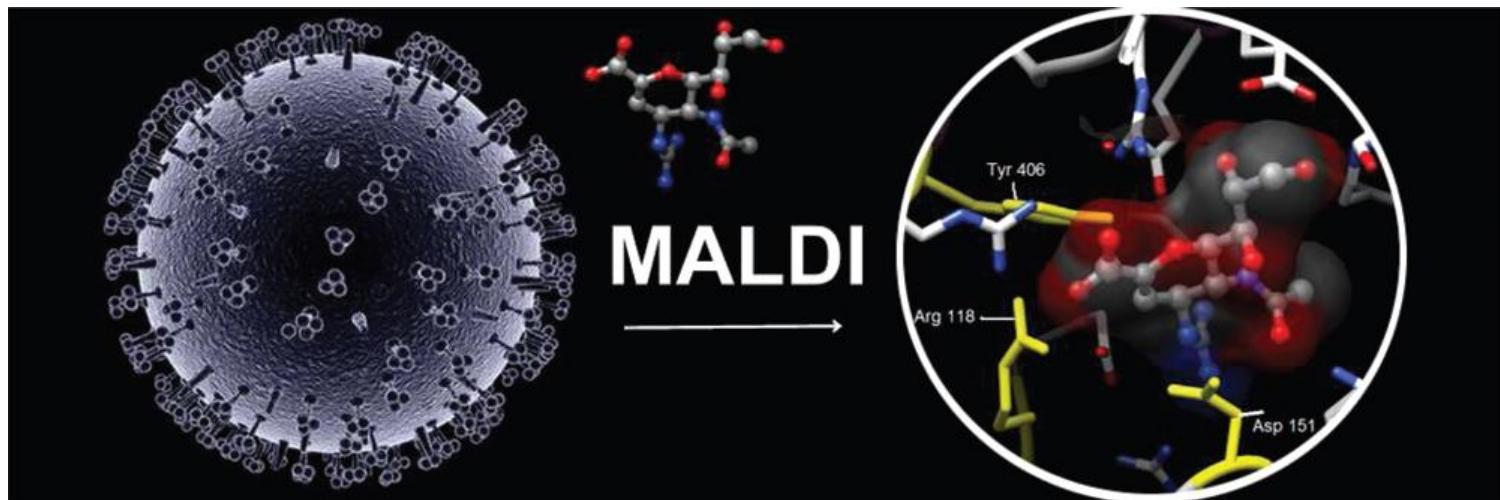

Mass spectrometry

The influenza virus, vaccine and antiviral drugs that target the virus can be characterized by different genetic and proteomic approaches. One of the most important and advantageous is mass spectrometry (MS), especially high resolution mass spectrometry or mass mapping. ...

Anti-Viral Inhibitor Binding to Influenza Neuraminidase by MALDI Mass Spectrometry

Kavya Swaminathan and Kevin M. Downard*

School of Molecular Bioscience University of Sydney, Sydney, NSW 2006, Australia

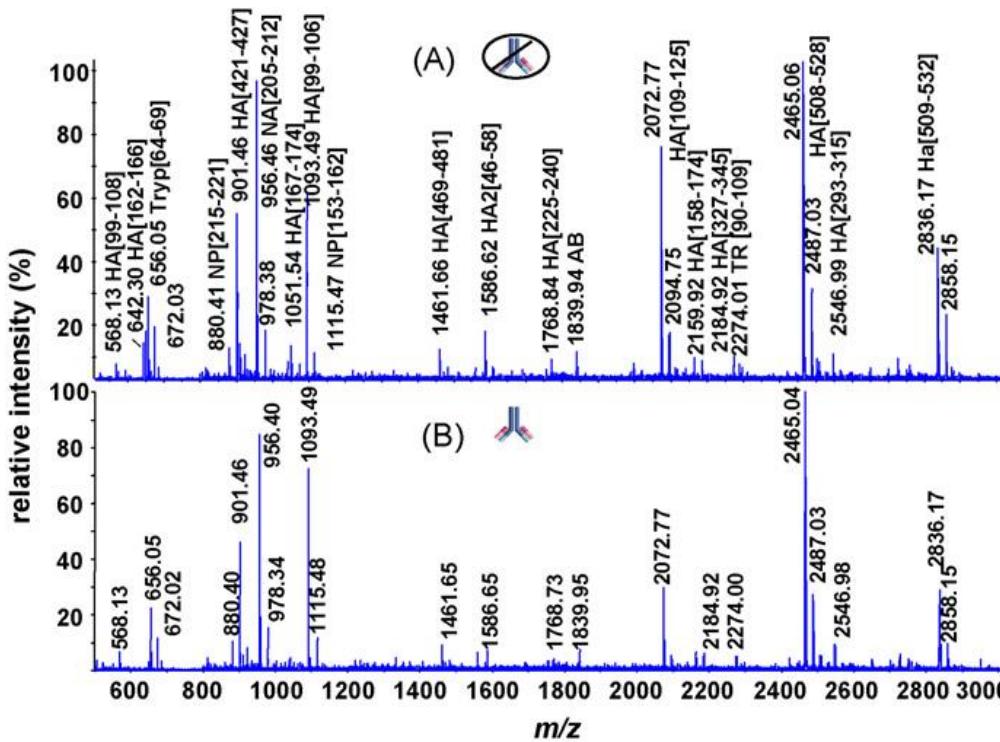

Antigenic characterisation of H3N2 subtypes of the influenza virus by mass spectrometry

Bethny Morrissey, Margaret Streamer, Kevin M. Downard*

School of Molecular & Microbial Biosciences, The University of Sydney, Australia

JOURNAL OF VIROLOGICAL METHODS Volume: 145 Issue: 2 Pages: 106-114 Published: NOV 2007

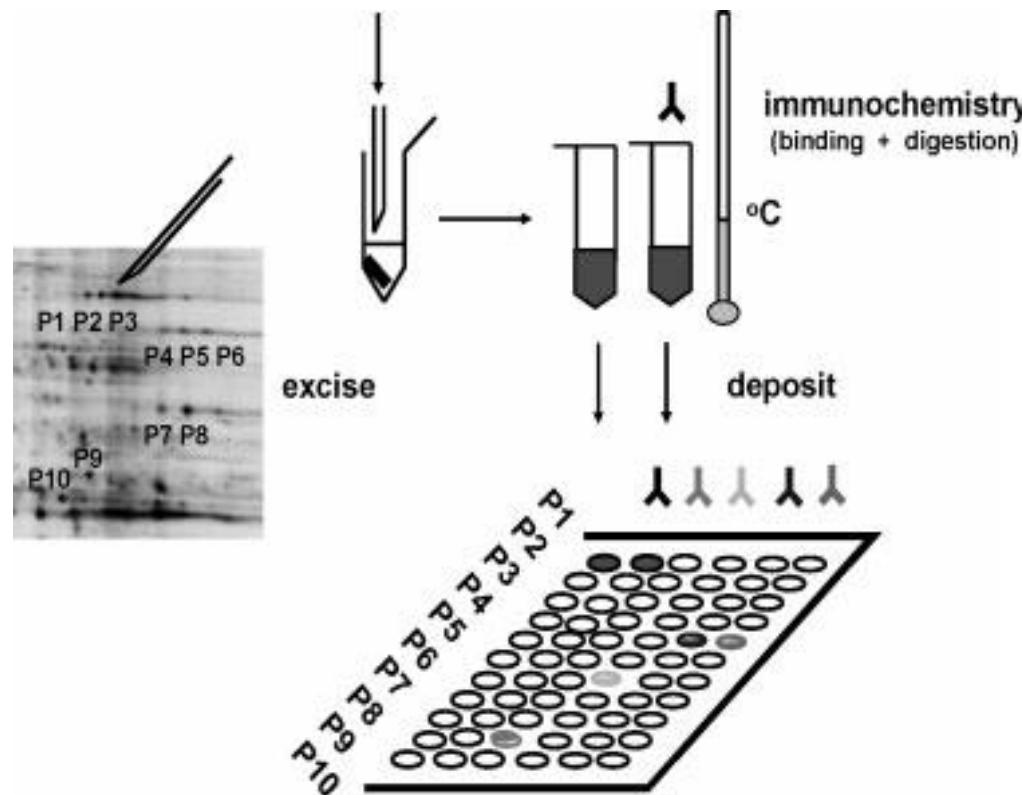

MALDI mass spectra of gel-recovered hemagglutinin after tryptic digestion of the Panama2007/99 type A strain (A) without antibody and (B) after 24 h incubation with monoclonal antibody raised to a H3N2 serotype.

A proteomics approach to survey the antigenicity of the influenza virus by mass spectrometry

Bethny Morrissey and Kevin M. Downard

School of Molecular and Microbial Biosciences, The University of Sydney, Sydney, Australia

PROTEOMICS Volume: 6 Issue: 7 Pages: 2034-2041 Published: APR 2006

Schematic representation of the MALDI array in which two spots (shaded) on the target represent untreated and antibody-treated samples of a gel-resolved protein (P) in order to determine the antigenicity of the component antigen. Additional lanes of the MALDI target can be used to assess the interaction of protein antigens with other antibodies where the other shaded spots denote a located epitope.

Spektroskopie laserem buzeného plazmatu

LIBS

(Laser-Induced Breakdown Spectroscopy)

High energy laser pulse - sample interaction:

three steps in dependence on laser energy

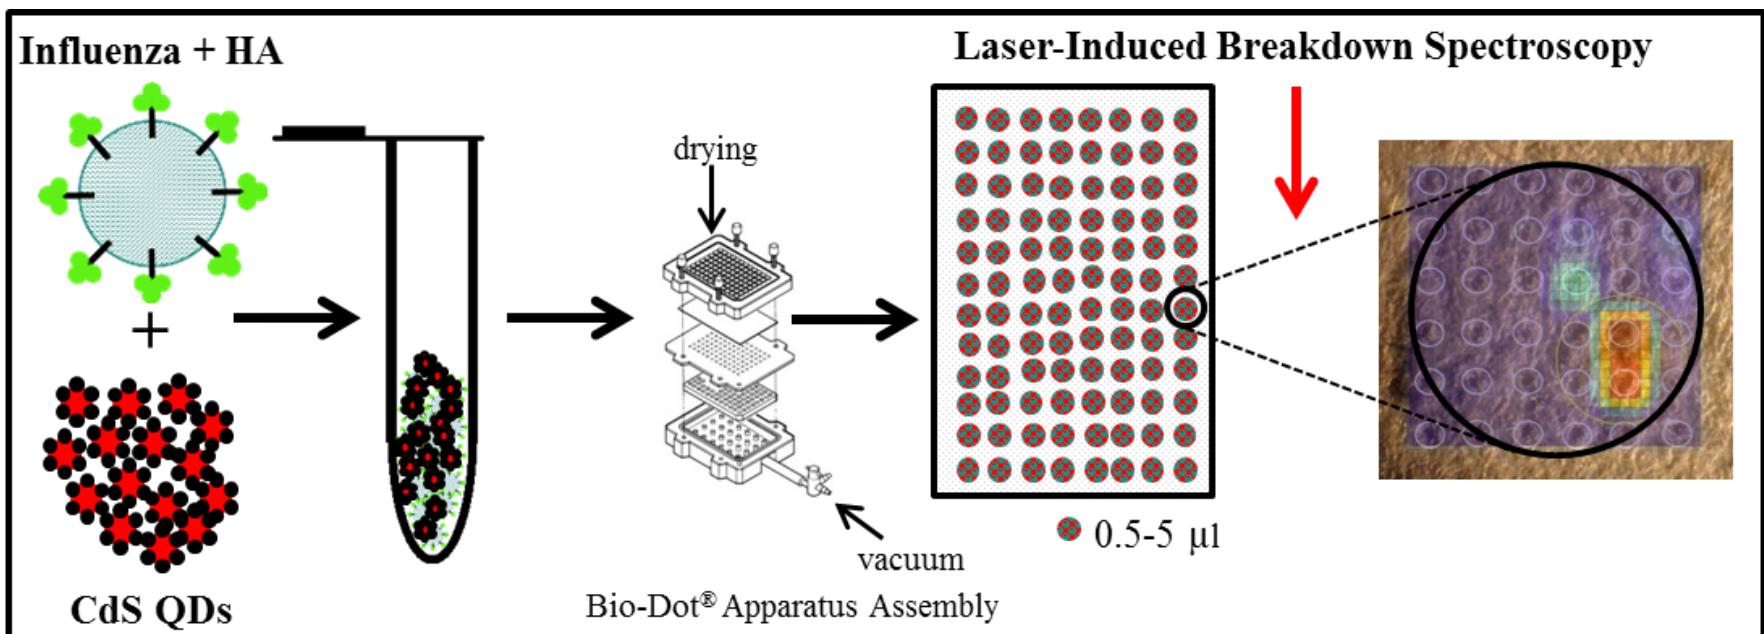

- damage threshold – **surface modification**
(observable in an optical microscope)
- ablation threshold – **material removal**
(LA-ICP-OES/MS signal starts to occur)
- plasma threshold – **optical breakdown of the vapour phase**
(plasma ignition - LIBS signal)

Laser beam - solid sample interaction

Spatially resolved determination of CdS quantum dots and its complexes with influenza hemagglutinin by Laser-Induced Breakdown Spectroscopy
